The first week after we had been assigned our groups I (PJ) messaged all group members to arrange a meeting along with both our faculty advisor and company we are designing our application for. The following week we met with Cylosoft and received our requirements for the project. We learned our first steps would be to start designing our database, using blogengine.NET as a reference. This was the previous application they were using, but it has not been updated in quite a few years. During the meeting they had stressed they would like us to use GitHub, after talking with Mohamed I learned this was not feasible. So instead I was able to get them access to our GitLab repository which was satisfactory to them.

The following week we met as a group again and began mapping out what tables and entries for each one. We discussed the other various requirements Cylosoft is looking for us to incorporate into our application, and created our weekly plan for the current semester. Moving forward, and following the weekly plan, we will begin to iron out more details about the database and begin on a visual representation of it.
